Documentation Preferential Looking paradigm

By Chris van Run (11-06-2015)

Several settings need to be set in the participant record. For the sake of simplicity in configuring the script one of the two stimuli is thought of as a target. One then sets a few variables in respect to this so called target. The other stimulus is automatically configured based on the settings of the other stimulus.

Type	Options	Notes
Condition	'IDS' or 'ADS'	Plays audio stimuli from either the ADS or IDS directory
image_pair	'1' or '2'	Selects the prefix for the image file: either '1_' or '2_'
target_image	'1' or '2'	Sets the 'target' to either image 1 or 2.
target_side	'LEFT' or 'RIGHT'	Sets the position of the 'target'.
target_word	'MODI' or 'DOBOE'	Sets which word pair is to be used. Nb: the first word of the pair is automatically set for the 'target'.

There are no groups to be selected.

The participant record variables that are prefixed with 'target_' are combined into a directory path. In this directory a selection of CVS files are expected that contain the selected settings. The directory path is build as follows:

<stimuli_dir()>/<target_side><target_image><target_word> (e.g. LEFT1MODI)
